The claimed invention

The claimed invention relates to routing data packets in a compressed-header domain.

The following documents were cited in the International Search Report:

D1: US 5920566 A D2: US 6278709 A D3: WO 02076042 A

D1 discloses a method and system in which a router operates by parsing the header of a received packet, making decisions based on a routing/switching table inside the router, and forwarding the packet with any required header modifications to the next node or end-station. One modification of a header is to simply replace the header.

D2 discloses a routing switch. The method of D2 involves grouping outputs which are suitable for outputting the same message. In the routing network, unicast packets include multiple headers and multicast packets include single headers.

D3 relates to a method for selectively inserting entries into a cache memory in which incoming data packets are directed to output links according to address information.

All the cited references fail to disclose routing in a compressed-header domain. Neither is there any disclosure in the cited references of leaving information contained in the expressed header section unchanged. On the contrary, in both D1 and D2 the header information may very well be modified or even replaced by other information.
